(54) Title: INHIBITORS OF c-JUN N-TERMINAL KINASES (JNK)

(57) Abstract

The present invention relates to compounds of formula (I) or (II), or a pharmaceutically acceptable derivative or prodrug thereof; wherein Y is selected from $-(CH_2)-Q_1$; $-(CO)-Q_1$; $-(CO)-NH-Q_1$; $-(CO)-O-Q_1$; $-(SO_2)-Q_1$ or $-(SO_2)NH-Q_1$; Q_1 is a C_1-C_6 straight chain or branched alkyl or alkenyl group; a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring; or a 9-14 membered bicyclic or tricyclic aromatic or non-aromatic carbocyclic or heterocyclic ring system, W is N or C; Z is CH or N, which are inhibitors of JNK, a mammalian protein kinase involved cell proliferation, cell death and response to extracellular stimuli. The invention also relates to methods for producing these inhibitors. The invention also provides pharmaceutical compositions comprising the inhibitors of the invention and methods of utilizing those compositions in the treatment and prevention of various disorders.

INHIBITORS OF C-JUN N-TERMINAL KINASES (JNK)

TECHNICAL FIELD OF INVENTION

The present invention relates to inhibitors of c-Jun N-terminal kinases (JNK), which are members of the 5 mitogen-activated protein (MAP) kinase family. There are a number of different genes and isoforms which encode JNKs. Members of the JNK family regulate signal transduction in response to environmental stress and proinflammatory cytokines and have been implicated to 10 have a role in mediating a number of different disorders. The invention also relates to methods for producing these inhibitors. The invention also provides pharmaceutical compositions comprising the inhibitors of the invention and methods of utilizing those compositions in the 15 treatment and prevention of various disorders.

BACKGROUND OF THE INVENTION

Mammalian cells respond to extracellular stimuli by activating signaling cascades that are mediated by members of the mitogen-activated protein (MAP) kinase 20 family, which include the extracellular signal regulated kinases (ERKs), the p38 MAP kinases and the c-Jun Nterminal kinases (JNKs). MAP kinases (MAPKs) are activated by a variety of signals including growth factors, cytokines, UV radiation, and stress-inducing agents. MAPKs are serine/threonine kinases and their activation occur by dual phosphorylation of threonine and tyrosine at the Thr-X-Tyr segment in the activation loop.

25

MAPKs phosphorylate various substrates including transcription factors, which in turn regulate the expression of specific sets of genes and thus mediate a specific response to the stimulus.

5

10

15

20

One particularly interesting kinase family are the c-Jun NH₂-terminal protein kinases, also known as JNKs. Three distinct genes, JNK1, JNK2, JNK3 have been identified and at least ten different splicing isoforms of JNKs exist in mammalian cells [Gupta et al., EMBO J., 15:2760-70 (1996)]. Members of the JNK family are activated by proinflammatory cytokines, such as tumor necrosis factor- α (TNF α) and interleukin-1 β (IL-1 β), as well as by environmental stress, including anisomycin, UV irradiation, hypoxia, and osmotic shock [Minden et al., Biochemica et Biophysica Acta, 1333:F85-F104 (1997)].

The down-stream substrates of JNKs include transcription factors c-Jun, ATF-2, Elk1, p53 and a cell death domain protein (DENN) [Zhang et al. Proc. Natl. Acad. Sci. USA, 95:2586-91 (1998)]. Each JNK isoform binds to these substrates with different affinities, suggesting a regulation of signaling pathways by substrate specificity of different JNKs in vivo (Gupta et al., supra).

JNKs, along with other MAPKs, have been

25 implicated in having a role in mediating cellular response
to cancer, thrombin-induced platelet aggregation,
immunodeficiency disorders, autoimmune diseases, cell
death, allergies, osteoporosis and heart disease. The
therapeutic targets related to activation of the JNK

30 pathway include chronic myelogenous leukemia (CML),
rheumatoid arthritis, asthma, osteoarthritis, ischemia,
cancer and neurodegenerative diseases.

WO 00/64872

20

25

30

PCT/US00/10866

Several reports have detailed the importance of JNK activation associated with liver disease or episodes of hepatic ischemia [Nat. Genet. 21:326-9 (1999); FEBS

Lett. 420:201-4 (1997); J. Clin. Invest. 102:1942-50

(1998); Hepatology 28:1022-30 (1998)]. Therefore, inhibitors of JNK may be useful to treat various hepatic disorders.

A role for JNK in cardiovascular disease such as myocardial infarction or congestive heart failure has also been reported as it has been shown JNK mediates hypertrophic responses to various forms of cardiac stress [Circ. Res. 83:167-78 (1998); Circulation 97:1731-7 (1998); J. Biol. Chem. 272:28050-6 (1997); Circ. Res. 79:162-73 (1996); Circ. Res. 78:947-53 (1996); J. Clin. Invest. 97:508-14 (1996)].

It has been demonstrated that the JNK cascade also plays a role in T-cell activation, including activation of the IL-2 promoter. Thus, inhibitors of JNK may have therapeutic value in altering pathologic immune responses [J. Immunol. 162:3176-87 (1999); Eur. J. Immunol. 28:3867-77 (1998); J. Exp. Med. 186:941-53 (1997); Eur. J. Immunol. 26:989-94 (1996)].

A role for JNK activation in various cancers has also been established, suggesting the potential use of JNK inhibitors in cancer. For example, constitutively activated JNK is associated with HTLV-1 mediated tumorigenesis [Oncogene 13:135-42 (1996)]. JNK may play a role in Kaposi's sarcoma (KS) because it is thought that the proliferative effects of bFGF and OSM on KS cells are mediated by their activation of the JNK signaling pathway [J. Clin. Invest. 99:1798-804 (1997)]. Other proliferative effects of other cytokines implicated in KS

PCT/US00/10866 WO 00/64872

-4-

proliferation, such as vascular endothelial growth factor (VEGF), IL-6 and TNFα, may also be mediated by JNK. addition, regulation of the c-jun gene in p210 BCR-ABL transformed cells corresponds with activity of JNK, suggesting a role for JNK inhibitors in the treatment for chronic myelogenous leukemia (CML) [Blood 92:2450-60 (1998)].

10

30

JNK1 and JNK2 are widely expressed in a variety of tissues. In contrast, JNK3, is selectively expressed in the brain and to a lesser extent in the heart and testis [Gupta et al., supra; Mohit et al., Neuron 14:67-78 (1995); Martin et al., Brain Res. Mol. Brain Res. 35:47-57 (1996)]. JNK3 has been linked to neuronal apoptosis induced by kainic acid, indicating a role of JNK in the pathogenesis of glutamate neurotoxicity. In the adult human brain, JNK3 expression is localized to a subpopulation of pyramidal neurons in the CA1, CA4 and subjculum regions of the hippocampus and layers 3 and 5 of the neocortex [Mohit et al., supra]. The CAl neurons of patients with acute hypoxia showed strong nuclear JNK3immunoreactivity compared to minimal, diffuse cytoplasmic staining of the hippocampal neurons from brain tissues of normal patients [Zhang et al., supra]. Thus, JNK3 appears to be involved involved in hypoxic and ischemic damage of 25 CA1 neurons in the hippocampus.

In addition, JNK3 co-localizes immunochemically with neurons vulnerable in Alzheimer's disease [Mohit et al., supra]. Disruption of the JNK3 gene caused resistance of mice to the excitotoxic glutamate receptor agonist kainic acid, including the effects on seizure activity, AP-1 transcriptional activity and apoptosis of hippocampal neurons, indicating that the JNK3 signaling

WO 00/64872 PCT/US00/10866

pathway is a critical component in the pathogenesis of glutamate neurotoxicity (Yang et al., <u>Nature</u>, 389:865-870 (1997)].

Based on these findings, JNK signalling,

5 especially that of JNK3, has been implicated in the areas
of apoptosis-driven neurodegenerative diseases such as
Alzheimer's Disease, Parkinson's Disease, ALS (Amyotrophic
Lateral Sclerosis), epilepsy and seizures, Huntington's
Disease, traumatic brain injuries, as well as ischemic and
10 hemorrhaging stroke.

There is a high unmet medical need to develop JNK specific inhibitors that are useful in treating the various conditions associated with JNK activation, especially considering the currently available, relatively inadequate treatment options for the majority of these conditions.

15

20

Recently, we have described crystallizable complexes of JNK protein and adenosine monophosphate, including complexes comprising JNK3, in U.S. Provisional Application 60/084056, filed May 4, 1998. Such information has been extremely useful in identifying and designing potential inhibitors of various members of the JNK family, which, in turn, have the described above therapeutic utility.

Much work has been done to identify and develop drugs that inhibit MAPKs, such as p38 inhibitors. See, e.g., WO 98/27098 and WO 95/31451. However, to our knowledge, no MAPK inhibitors have been shown to be specifically selective for JNKs versus other related

MAPKs.

Accordingly, there is still a great need to develop potent inhibitors of JNKs, including JNK3

inhibitors, that are useful in treating various conditions associated with JNK activation.

SUMMARY OF THE INVENTION

The present invention addresses this problem by providing compounds that demonstrate strong inhibition of JNK.

These compounds have the general formulae:

R is a C₁-C₆ straight chain or branched alkyl or alkenyl group, a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring, or a 9-10 membered bicyclic aromatic or non-aromatic carbocyclic or heterocyclic ring system.

Z is CH or N.

15

25

When Z is CH, the carbon is chiral. Both isomeric forms of the compound are encompassed by the instant invention. In addition, when Z is CH, the acidic nature of the CH proton can result in tautomeric structures of formula II, as shown below. These tautomeric structures,

$$\begin{array}{c|c}
A_{2} & & & & \\
A_{3} & & & & \\
A_{3} & & & & \\
\end{array}$$
and

20 are encompassed by the instant invention.

The present invention envisions all possible stereoisomers, enantiomers and racemic mixtures. For example, oxime compounds may exist in isomeric forms. The oxime compounds of this invention may exist as either an E-isomer, a Z-isomer, or a mixture of E- and Z-isomers.

 $\label{eq:conding} \mbox{ According to a preferred embodiment, Y is $$-(CH_2)-Q_1$.}$

 CR^3 .

10

25

According to a preferred embodiment, Q₁ is benzodioxanyl, an optionally substituted phenyl group, a substituted heterocyclic ring, a 10-membered heterocyclic bicyclic ring, or a straight chain alkyl group substituted with phenyl or a heterocyclic monocyclic or bicyclic ring.

 $\label{eq:According} \mbox{ According to a preferred embodiment, } \mbox{W} \mbox{ is } \mbox{N} \mbox{ and } \mbox{R}^8 \mbox{ is a lone pair of electrons.}$

According to a preferred embodiment, A_1 is CR^1 . According to a preferred embodiment, A_2 is CR^2 or

According to a preferred embodiment, A_3 is CR^2 or CR^3 .

According to a preferred embodiment, A_4 is CR^4 . According to a preferred embodiment, R^1 is R^5 .

In a more preferred embodiment, R¹ is H, methyl, halo, an optionally substituted phenyl, a monocyclic or bicyclic heterocycle, a substituted or unsubstituted alkyl, alkenyl or alkynyl, or COOR.

According to a preferred embodiment, R^2 is R^5 , 20 NH(CO)- R^6 , NH(SO₂)- R^6 , -NHCH₂ R^5 , CO-Q₁ or CONH-Q₁. In a more preferred embodiment, R^2 is H, halo, NO₂, NH₂, methyl, OCF₃, -N(R)₂, or substituted phenyl.

According to a preferred embodiment, R^3 is R^5 , $NH(CO)-R^6$, $NH(SO_2)-R^6$, $CONH-Q_1$, In a more preferred embodiment, R^3 is H, halo, methyl, CF_3 , substituted or unsubstituted phenyl, a heterocyclic ring, a bicyclic ring, NO_2 or NH_2 .

According to a preferred embodiment, R^4 is R^5 . In a more preferred embodiment, R^4 is H or methyl.

30 Some specific examples of preferred compounds of the instant invention are provided in Tables 1 to 17 below. In Tables 1 to 17, "+" represents a Ki \geq 1 μ M,

"++" represents a Ki < 1 μM_{\star} and "ND" means not determined. The Ki is determined by the method disclosed in Example 3.

According to another embodiment, the present invention provides methods of producing JNK inhibitors of the formulae I and II. Synthesis schemes for specific compounds are described in Examples 1 and 2.

Compounds of formula I, wherein W is N, may be prepared by standard synthetic methods, such as those described in Examples 1 and 2. Skilled practitioners would realize that these syntheses could be modified to provide other compound of formula I, wherein W is N.

Compounds of formula I, wherein W is C, may be prepared by standard synthetic methods, including the methods of Examples 1 and 2. Reaction of an appropriate oxindole in the presence of a compound of formula

5 R₈C(O)OCH₂CH₃ and a base, such as sodium ethoxide, in an appropriate solvent, such as ethanol would provide a substituted oxindole. Such a substituted oxindole could be subsequently reacted to form compounds of formula I, wherein W is C and R₈ is R₇ by, for example, the methods described in Examples 1 and 2.

Compounds of formula II, wherein Z is C may be prepared by standard synthetic methods. For example, compounds of formula I, wherein Z is C may be prepared from an oxindole compound, such as compound B in Example 1. Reaction of an oxindole compound in the presence of ammonia, a reagent such as phosgene, an appropriate base, and an appropriate solvent would provide a compound that could be subsequently reacted to form compounds of formula I, wherein Z is C.

15

25

30

Compounds of formula II, wherein Z is N may be prepared as described in Example 3.

According to another embodiment of the invention, the activity of the JNK inhibitors of this invention may be assayed in vitro, in vivo or in a cell line. In vitro assays include assays that determine inhibition of either the kinase activity or ATPase activity of activated JNK. For example, see Examples 3-5. Alternate in vitro assays quantitate the ability of the inhibitor to bind to JNK and may be measured either by radiolabelling the inhibitor prior to binding, isolating the inhibitor/JNK complex and determining the amount of

radiolabel bound, or by running a competition experiment where new inhibitors are incubated with JNK bound to known radioligands. One may use any type or isoform of JNK, depending upon which JNK type or isoform is to be inhibited.

The JNK inhibitors or pharmaceutical salts
thereof may be formulated into pharmaceutical compositions
for administration to animals or humans. These
pharmaceutical compositions, which comprise an amount of
JNK inhibitor effective to treat or prevent a JNK-mediated
condition and a pharmaceutically acceptable carrier, are
another embodiment of the present invention.

The term "JNK-mediated condition", as used herein means any disease or other deleterious condition in which JNK is known to play a role. Such conditions include, without limitation, inflammatory diseases, autoimmune diseases, destructive bone disorders, proliferative disorders, cancer, infectious diseases, neurodegenerative diseases, allergies,

reperfusion/ischemia in stroke, heart attacks, angiogenic disorders, organ hypoxia, vascular hyperplasia, cardiac hypertrophy, thrombin-induced platelet aggregation, and conditions associated with prostaglandin endoperoxidase synthase-2.

Inflammatory diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, acute pancreatitis, chronic pancreatitis, asthma, allergies, and adult respiratory distress syndrome.

Autoimmune diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, glomerulonephritis, rheumatoid

-109-

arthritis, systemic lupus erythematosus, scleroderma, chronic thyroiditis, Graves' disease, autoimmune gastritis, diabetes, autoimmune hemolytic anemia, autoimmune neutropenia, thrombocytopenia, atopic dermatitis, chronic active hepatitis, myasthenia gravis, multiple sclerosis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, psoriasis, or graft vs. host disease.

Destructive bone disorders which may be treated or prevented by the compounds of this invention include, but are not limited to, osteoporosis, osteoarthritis and multiple myeloma-related bone disorder.

10

15

20

25

Proliferative diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, acute myelogenous leukemia, chronic myelogenous leukemia, metastatic melanoma, Kaposi's sarcoma, multiple myeloma and HTLV-1 mediated tumorigenesis.

Angiogenic disorders which may be treated or prevented by the compounds of this invention include solid tumors, ocular neovasculization, infantile haemangiomas. Infectious diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, sepsis, septic shock, and Shigellosis.

Viral diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, acute hepatitis infection (including hepatitis A, hepatitis B and hepatitis C), HIV infection and CMV retinitis.

Neurodegenerative diseases which may be treated or prevented by the compounds of this invention include, but are not limited to, Alzheimer's disease, Parkinson's

-110-

disease, amyotrophic lateral sclerosis (ALS), epilepsy, seizures, Huntington's disease, traumatic brain injury, ischemic and hemorrhaging stroke, cerebral ischemias or neurodegenerative disease, including apoptosis-driven neurodegenerative disease, caused by traumatic injury, acute hypoxia, ischemia or glutamate neurotoxicity.

"JNK-mediated conditions" also include ischemia/reperfusion in stroke, heart attacks, myocardial ischemia, organ hypoxia, vascular hyperplasia, cardiac hypertrophy, hepatic ischemia, liver disease, congestive heart failure, pathologic immune responses such as that caused by T cell activation and thrombin-induced platelet aggregation.

In addition, JNK inhibitors of the instant

invention may be capable of inhibiting the expression of inducible pro-inflammatory proteins. Therefore, other "JNK-mediated conditions" which may be treated by the compounds of this invention include edema, analgesia, fever and pain, such as neuromuscular pain, headache,

cancer pain, dental pain and arthritis pain.

In addition to the compounds of this invention, pharmaceutically acceptable derivatives or prodrugs of the compounds of this invention may also be employed in compositions to treat or prevent the above-identified disorders.

25

30

A "pharmaceutically acceptable derivative or prodrug" means any pharmaceutically acceptable salt, ester, salt of an ester or other derivative of a compound of this invention which, upon administration to a recipient, is capable of providing, either directly or indirectly, a compound of this invention or an inhibitorily active metabolite or residue thereof.

-111-

Particularly favored derivatives or prodrugs are those that increase the bioavailability of the compounds of this invention when such compounds are administered to a mammal (e.g., by allowing an orally administered compound to be more readily absorbed into the blood) or which enhance delivery of the parent compound to a biological compartment (e.g., the brain or lymphatic system) relative to the parent species.

Pharmaceutically acceptable prodrugs of the compounds of this invention include, without limitation, esters, amino acid esters, phosphate esters, metal salts and sulfonate esters.

10

Pharmaceutically acceptable salts of the compounds of this invention include those derived from pharmaceutically acceptable inorganic and organic acids 15 and bases. Examples of suitable acid salts include acetate, adipate, alginate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, citrate, camphorate, camphorsulfonate, cyclopentanepropionate, 20 digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptanoate, glycerophosphate, glycolate, hemisulfate, heptanoate, hexanoate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate, lactate, maleate, malonate, methanesulfonate, 2naphthalenesulfonate, nicotinate, nitrate, oxalate, 25 palmoate, pectinate, persulfate, 3-phenylpropionate, phosphate, picrate, pivalate, propionate, salicylate, succinate, sulfate, tartrate, thiocyanate, tosylate and undecanoate. Other acids, such as oxalic, while not in 30 themselves pharmaceutically acceptable, may be employed in the preparation of salts useful as intermediates in obtaining the compounds of the invention and their

pharmaceutically acceptable acid addition salts.

Salts derived from appropriate bases include alkali metal (e.g., sodium and potassium), alkaline earth metal (e.g., magnesium), ammonium and N-(Cl-4 alkyl)4+ salts. This invention also envisions the quaternization of any basic nitrogen-containing groups of the compounds disclosed herein. Water or oil-soluble or dispersible products may be obtained by such quaternization.

Pharmaceutically acceptable carriers that may be

used in these pharmaceutical compositions include, but are
not limited to, ion exchangers, alumina, aluminum
stearate, lecithin, serum proteins, such as human serum
albumin, buffer substances such as phosphates, glycine,
sorbic acid, potassium sorbate, partial glyceride mixtures
of saturated vegetable fatty acids, water, salts or
electrolytes, such as protamine sulfate, disodium hydrogen
phosphate, potassium hydrogen phosphate, sodium chloride,
zinc salts, colloidal silica, magnesium trisilicate,
polyvinyl pyrrolidone, cellulose-based substances,
polyethylene glycol, sodium carboxymethylcellulose,
polyacrylates, waxes, polyethylene-polyoxypropylene-block
polymers, polyethylene glycol and wool fat.

The compositions of the present invention may be administered orally, parenterally, by inhalation spray,

25 topically, rectally, nasally, buccally, vaginally or via an implanted reservoir. The term "parenteral" as used herein includes subcutaneous, intravenous, intramuscular, intra-articular, intra-synovial, intrasternal, intrathecal, intrahepatic, intralesional and intracranial injection or infusion techniques. Preferably, the compositions are administered orally, intraperitoneally or intravenously.

-113-

Sterile injectable forms of the compositions of this invention may be aqueous or oleaginous suspension. These suspensions may be formulated according to techniques known in the art using suitable dispersing or 5 wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterallyacceptable diluent or solvent, for example as a solution in 1,3-butanediol. Among the acceptable vehicles and solvents that may be employed are water, Ringer's solution 10 and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono- or diglycerides. Fatty acids, such as oleic acid and its 15 glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically-acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long-chain alcohol diluent 20 or dispersant, such as carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms including emulsions and suspensions. Other commonly used 25 surfactants, such as Tweens, Spans and other emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation.

The pharmaceutical compositions of this invention may be orally administered in any orally acceptable dosage form including, but not limited to,

capsules, tablets, aqueous suspensions or solutions. the case of tablets for oral use, carriers commonly used include lactose and corn starch. Lubricating agents, such as magnesium stearate, are also typically added. For oral 5 administration in a capsule form, useful diluents include lactose and dried cornstarch. When aqueous suspensions are required for oral use, the active ingredient is combined with emulsifying and suspending agents. If desired, certain sweetening, flavoring or coloring agents may also be added.

Alternatively, the pharmaceutical compositions of this invention may be administered in the form of suppositories for rectal administration. These can be prepared by mixing the agent with a suitable nonirritating excipient which is solid at room temperature 15 but liquid at rectal temperature and therefore will melt in the rectum to release the drug. Such materials include cocoa butter, beeswax and polyethylene glycols.

10

The pharmaceutical compositions of this 20 invention may also be administered topically, especially when the target of treatment includes areas or organs readily accessible by topical application, including diseases of the eye, the skin, or the lower intestinal tract. Suitable topical formulations are readily prepared 25 for each of these areas or organs.

Topical application for the lower intestinal tract can be effected in a rectal suppository formulation (see above) or in a suitable enema formulation. Topically-transdermal patches may also be used.

30 For topical applications, the pharmaceutical compositions may be formulated in a suitable ointment containing the active component suspended or dissolved in

PCT/US00/10866 WO 00/64872

-115-

one or more carriers. Carriers for topical administration of the compounds of this invention include, but are not limited to, mineral oil, liquid petrolatum, white petrolatum, propylene glycol, polyoxyethylene, 5 polyoxypropylene compound, emulsifying wax and water. Alternatively, the pharmaceutical compositions can be formulated in a suitable lotion or cream containing the active components suspended or dissolved in one or more pharmaceutically acceptable carriers. Suitable carriers include, but are not limited to, mineral oil, sorbitan 10 monostearate, polysorbate 60, cetyl esters wax, cetearyl

For ophthalmic use, the pharmaceutical compositions may be formulated as micronized suspensions 15 in isotonic, pH adjusted sterile saline, or, preferably, as solutions in isotonic, pH adjusted sterile saline, either with or without a preservative such as benzylalkonium chloride. Alternatively, for ophthalmic uses, the pharmaceutical compositions may be formulated in an ointment such as petrolatum.

20

25

30

alcohol, 2-octyldodecanol, benzyl alcohol and water.

The pharmaceutical compositions of this invention may also be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well-known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other conventional solubilizing or dispersing agents.

The amount of JNK inhibitor that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated, the particular

mode of administration. Preferably, the compositions should be formulated so that a dosage of between 0.01 - 100 mg/kg body weight/day of the inhibitor can be administered to a patient receiving these compositions.

5

10

30

It should also be understood that a specific dosage and treatment regimen for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, rate of excretion, drug combination, and the judgment of the treating physician and the severity of the particular disease being treated. The amount of inhibitor will also depend upon the particular compound in the composition.

According to another embodiment, the invention

15 provides methods for treating or preventing a JNK-mediated condition comprising the step of administering to a patient one of the above-described pharmaceutical compositions. The term "patient", as used herein, means an animal, preferably a human.

Preferably, that method is used to treat or prevent a condition selected from inflammatory diseases, autoimmune diseases, destructive bone disorders, proliferative disorders, infectious diseases, degenerative diseases, neurodegenerative diseases, allergies,

25 reperfusion/ischemia in stroke, heart attacks, angiogenic disorders, organ hypoxia, vascular hyperplasia, cardiac hypertrophy, and thrombin-induced platelet aggregation, or any specific disease or disorder described above.

Depending upon the particular JNK-mediated condition to be treated or prevented, additional drugs, which are normally administered to treat or prevent that condition, may be administered together with the

-117-

inhibitors of this invention. For example, chemotherapeutic agents or other anti-proliferative agents may be combined with the JNK inhibitors of this invention to treat proliferative diseases.

Those additional agents may be administered separately, as part of a multiple dosage regimen, from the JNK inhibitor-containing composition. Alternatively, those agents may be part of a single dosage form, mixed together with the JNK inhibitor in a single composition.

5

10

In order that the invention described herein may be more fully understood, the following examples are set forth. It should be understood that these examples are for illustrative purposes only and are not to be construed as limiting this invention in any manner.

### EXAMPLE 1

### Synthesis of JNK Inhibitor Compound 152

1.1 equivalents of diethyl malonate and 2.2 equivalents of sodium hydroxide was suspended in dimethyl sulfoxide
5 (DMSO) and stirred at 80°C for 24 hours (h). Thin layer chromatography (TLC) was use to indicate that the reaction

One equivalent of 2-nitro-4-bromobenzenbromide,

was complete. The reaction mixture was then cooled to room temperature, acidified with 2N HCl, then extracted with

5

-119-

ethyl acetate. The organic phase was washed with saturated NaCl 3 times and dried with MgSO4. The solvent was removed under reduced pressure. Compound A was purified by chromatography. The yield was 78%.

One equivalent of compound A and 3 equivalents of Fe were refluxed in acetic acid for 3 h, then the reaction mixture was cooled to room temperature. Saturated NaCl and ethyl acetate was added to the reaction mixture, the organic phase was washed with saturated NaCl 3 times, dried with MgSO₄, and the solvent was removed 10 under reduced pressure. Compound B was purified by chromatography. The yield was 90%.

To one equivalent of compound B, 1.4 equivalents of sodium ethoxide in ethyl alcohol was added at room 15 temperature. The reaction mixture was stirred at 60°C for 1 h, then 3.7 equivalents of ethylformate was added to the mixture. The mixture was stirred at 60°C for 30 minutes, during which time a large amount of precipitate was TLC indicated that the reaction was complete. 20

The reaction mixture was cooled to room temperature. 1N HCl was added to the reaction mixture. The reaction mixture was then filtered to yield a filtration cake, which was compound C. The yield was great than 95%.

To one equivalent of compound C, 1.2 equivalents of a  $K_2CO_3/DMF$  suspension was added. 1.2 equivalents of 25 methoxy-O-methyl chloride (MOMCl) was added at room temperature slowly until TLC indicated that there was no more compound C present. Saturated NaCl and ethyl acetate was added to the reaction mixture. The organic phase was 30 washed with saturated NaCl 3 times and then was dried with Mg504. The solvent was removed under reduced pressure. Compound D was purified by chromatography. The yield was

80%.

10

. 25

One equivalent of Compound D was dissolved in a 4 to 1 ratio of tert-butanol (t-BuOH)/dioxane solution. Three equivalents of a saturated aqueous K2CO3 solution was added to the reaction mixture, followed by 16 equivalents of a NaIO4 saturated solution and 0.25 equivalents of a KMnO4 saturated solution. The reaction mixture was stirred at room temperature for 1 h. TLC indicated the reaction was completed. Ethyl acetate and H2O was added to the reaction mixture, the organic phase was washed with saturated NaCl 3 times, dried with MgSO4 and the solvent was removed under reduced pressure. The residue was compound E. The yield was 88%.

One equivalent of Compound E was mixed with 1.2 15 equivalents of 8-(chloromethyl)-6-fluorobenzo-1,3-dioxan and 1.2 equivalents of K2CO3 in a DMF suspension and stirred at room temperature overnight. TLC indicated the reaction was complete. Saturated NaCl and ethyl acetate was added to the reaction mixture, the organic phase was 20 washed with saturated NaCl 3 times, dried with MgSO4 and the solvent was removed under reduced pressure. Compound F was purified by chromatography. The yield was 80%.

One equivalent of Compound F, 1.3 equivalents of hydroxylamine hydrochloride and 2.6 equivalents of K2CO3 in a DMF suspension were stirred together at room temperature overnight. TLC indicated the reaction was complete. Saturated NaCl and ethyl acetate was added to the reaction mixture, the organic phase was washed with saturated NaCl 3 times, dried with MgSO4, and the solvent 30 was removed under reduced pressure. Compound 152 was purified by chromatography.

-121-

### EXAMPLE 2

### Synthesis of JNK Inhibitor Compound 153

153

One equivalent of Compound F (prepared as in 5 Example 1), 1.2 eq of phenyl boronic acid, Na₂CO₃, and a catalytical amount of tetrakis triphenylphosphine palladium toluene was suspended in water and stirred at 80°C overnight. Saturated NaCl and ethyl acetate was added to the reaction mixture, the organic phase was dried with 10 MgSO₄, and the solvent was removed under reduced pressure. Compound G was purified by chromatography. The yield was 64%.

One equivalent of Compound G, 1.3 equivalents of hydroxylamine hydrochloride and 2.6 equivalents of K₂CO₃

15 in a DMF suspension were stirred together at room temperature overnight. TLC indicated the reaction was complete. Saturated NaCl and ethyl acetate was added to the reaction mixture, the organic phase was washed with saturated NaCl 3 times, dried with MgSO₄, and the solvent was removed under reduced pressure. Compound 153 was

purified by chromatography.

### EXAMPLE 3

# 5 Solid Phase Synthesis of JNK Inhibitors of Formula II, Wherein Z is N

Compounds of formula II, wherein Z is N, may be prepared as shown in the above synthetic scheme. The synthetic scheme may be modified to provide other compounds of formula II, wherein Z is N.

-123-

#### EXAMPLE 4

### Cloning, Expression and Purification of JNK3 Protein

A BLAST search of the EST database using the published JNK3@1 cDNA as a query identified an EST clone (#632588) that contained the entire coding sequence for 5 human JNK $3\alpha$ 1. Polymerase chain reactions (PCR) using pfu polymerase (Strategene) were used to introduce restriction sites into the cDNA for cloning into the pET-15B expression vector at the NcoI and BamHI sites. protein was expressed in E. coli. Due to the poor 10 solubility of the expressed full-length protein (Met 1-Gln 422), an N-terminally truncated protein starting at Ser residue at position 40 (Ser 40) was produced. This truncation corresponds to Ser 2 of JNK1 and JNK2 proteins, and is preceded by a methionine (initiation) and a glycine 15 residue. The glycine residue was added in order to introduce an NcoI site for cloning into the expression vector. In addition, systematic C-terminal truncations were performed by PCR to identify a construct that give 20 rise to diffraction-quality crystals. One such construct encodes amino acid residues Ser40-Glu402 of  $JNK3\alpha1$  and is preceded by Met and Gly residues.

The construct was prepared by PCR using deoxyoligonucleotides

5' GCTCTAGAGCTCCATGGGCAGCAAAAGCAAAGTTGACAA 3' (forward primer with initiation codon underlined) and 5' TAGCGGATCCTCATTCTGAATTCATTACTTCCTTGTA 3' (reverse primer with stop codon underlined) as primers and was confirmed by DNA sequencing. Control experiments indicated that the truncated JNK3 protein had an equivalent kinase activity towards myelin basic protein when activated with an upstream kinase MKK7 in vitro.

-124-

E.coli strain BL21 (DE3) (Novagen) was transformed with the JNK3 expression construct and grown at 30°C in LB supplemented with 100 µg/ml carbenicillin in shaker flasks until the cells were in log phase (OD600 ~ 0.8). Isopropylthio- $\beta$ -D-galactosidase (IPTG) was added to a final concentration of 0.8 mM and the cells were harvested 2 hours later by centrifugation.

E. coli cell paste containing JNK3 was resuspended in 10 volumes/g lysis buffer (50 mM HEPES, pH 7.2, containing 10% glycerol (v/v), 100 mM NaCl, 2 mM DTT, 10 0.1 mM PMSF, 2 µg/ml Pepstatin, 1µg/ml each of E-64 and Leupeptin). Cells were lysed on ice using a microfluidizer and centrifuged at 100,000 x g for 30 min at 4 °C. The 100,000 x g supernatant was diluted 1:5 with 15 Buffer A (20 mM HEPES, pH 7.0, 10% glycerol (v/v), 2 mM DTT) and purified by SP-Sepharose (Pharmacia) cationexchange chromatography (column dimensions: 2.6 x 20 cm) at 4 °C. The resin was washed with 5 column volumes of Buffer A, followed by 5 column volumes of Buffer A 20 containing 50 mM NaCl. Bound JNK3 was eluted with a 7.5 column volume linear gradient of 50-300 mM NaCl. JNK3 eluted between 150-200 mM NaCl.

### EXAMPLE 5

25 Activation of JNK3

30

5 mg of JNK3 was diluted to 0.5 mg/ml in 50 mM HEPES buffer, pH 7.5, containing 100 mM NaCl, 5 mM DTT, 20 mM MgCl₂ and 1 mM ATP. GST-MKK7(DD) was added at a molar ratio of 1:2.5 GST-MKK7:JNK3. After incubation for 30 minutes at 25°C, the reaction mixture was concentrated 5-fold by ultrafiltration in a Centriprep-30 (Amicon, Beverly, MA), diluted to 10 ml and an additional 1 mM ATP

added. This procedure was repeated three times to remove ADP and replenish ATP. The final addition of ATP was 5 mM and the mixture incubated overnight at 4°C.

The activated JNK3/GST-MKK7 (DD) reaction mixture

was exchanged into 50 mM HEPES buffer, pH 7.5, containing

mM DTT and 5% glycerol (w/v) by dialysis or

ultrafiltration. The reaction mixture was adjusted to 1.1

M potassium phosphate, pH 7.5, and purified by hydrophobic interaction chromatography (at 25 °C) using a Rainin

Hydropore column. GST-MKK7 and unactivated JNK3 do not bind under these conditions such that when a 1.1 to 0.05 M potassium phosphate gradient is developed over 60 minutes at a flow rate of 1 ml/minute, doubly phosphorylated JNK3 is separated from singly phosphorylated JNK. Activated

JNK3 (i.e. doubly phosphorylated JNK3) was stored at -70°C at 0.25-1 mg/ml.

## EXAMPLE 6 JNK Inhibition Assays

20 Compounds were assayed for the inhibition of JNK3 by a spectrophotometric coupled-enzyme assay. this assay, a fixed concentration of activated JNK3 (10 nM) was incubated with various concentrations of a potential inhibitor dissolved in DMSO for 10 minutes at 30°C in a buffer containing 0.1 M HEPES buffer, pH 7.5, 25 containing 10 mM MgCl2, 2.5 mM phosphoenolpyruvate, 200 uM NADH, 150 µg/mL pyruvate kinase, 50 µg/mL lactate dehydrogenase, and 200 µM EGF receptor peptide. The EGF receptor peptide has the sequence KRELVEPLTPSGEAPNOALLR, and is a phosphoryl acceptor in the JNK3-catalyzed kinase 30 The reaction was initiated by the addition of reaction. 10 µM ATP and the assay plate is inserted into the

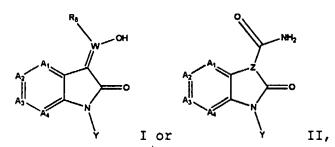

-126-

spectrophotometer's assay plate compartment that was maintained at  $30^{\circ}$ C. The decrease of absorbance at 340 nm was monitored as a function of time. The rate data as a function of inhibitor concentration was fitted to competitive inhibition kinetic model to determine the  $K_1$ .

### **CLAIMS**

We claim:

### 1. A compound of the formula:

or a pharmaceutically acceptable derivative or prodrug thereof; wherein

Y is selected from  $-(CH_2)-Q_1$ ;  $-(CO)-Q_1$ ;  $-(CO)NH-Q_1$ ;  $-(CO)-O-Q_1$ ;  $-(SO_2)-Q_1$  or  $-(SO_2)NH-Q_1$ ;

Q₁ is a C₁-C₆ straight chain or branched alkyl or alkenyl group; a 5-7 membered aromatic or non-aromatic

10 carbocyclic or heterocyclic ring; or a 9-14 membered bicyclic or tricyclic aromatic or non-aromatic carbocyclic or heterocyclic ring system, wherein said alkyl, alkenyl, ring or ring system is optionally substituted with one to four substituents, each of which is independently selected from NH₂, NH-R, N(R)₂, NO₂, OH, OR, CF₃, halo, CN, CO₂H, C(O)-NH₂, C(O)-NH-R, C(O)-N(R)₂, C(O)-R, SR, S(O)-R, S(O)₂-R, S(O)₂-NH-R or -R;

W is N or C;

wherein when W is N,  $R_{8}$  is a lone pair of

20 electrons; and

wherein when W is C, R₈ is R₇.

A₁ is N or CR¹;

A₂ is N or CR²;

 $A_3$  is N or  $CR^3$ ;

A₄ is N or CR⁴;

25

-128-

provided that at least one of  $A_1$ ,  $A_2$ ,  $A_3$  and  $A_4$ must not be N;

 $R^1$  is  $-NHR^5$ ,  $-OR^5$ ,  $-SR^5$ , or  $-R^5$ ;

R², R³, and R⁴ are independently selected from -(CO) NH₂, - (CO) NHR, - (CO) N(R)₂, -NHR⁵, -NHCH₂R⁵, -OR⁵, -SR⁵, - $R^5$ ,  $-NH(CO)-R^6$ ,  $-NH(CO)-NHR^6$ ,  $-NH(CO)-NH(CO)R^6$ ,  $-NH(CO)-OR^6$ ,  $-NH(SO_2)-R^6$ ,  $-NH(SO_2)-NHR^6$ , -C(O)OH, -C(O)OR,  $-(CO)-Q_1$ , -(CO) NH-Q₁, -(CO) NR-Q₁, -(CO) -O-Q₁, -(SO₂) -Q₁ or -(SO₂) NH-Q₁;

R⁵ and R⁶ are each independently selected from H;

N(R)₂, NHOH, NO₂, C(O)OR or halo; a C₁-C₆ straight chain or 10 branched alkyl, alkenyl or alkynyl group; a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring; or a 9-14 membered bicyclic or tricyclic aromatic or nonaromatic carbocyclic or heterocyclic ring; wherein said

alkyl, alkenyl, ring or ring system is optionally 15 substituted with one to four substituents, each of which is independently selected from NH2, NHR, NHC(O)OR, N(R)2, NO2, OH, OR, CF3, halo, CN, Si(R)3, CO2H, COOR, CONH2, CONHR,  $CON(R)_2$ , COR, SR, S(O)R,  $S(O)_2R$ ,  $S(O)_2NHR$  or R;

20

R⁷ is H; a C₁-C₆ straight chain or branched alkyl or alkenyl group; a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring; or a 9-14 membered bicyclic or tricyclic aromatic or non-aromatic carbocyclic or heterocyclic ring; wherein said alkyl, alkenyl, ring or ring system is optionally substituted with one to four 25 substituents, each of which is independently selected from NH2, NHR, N(R)2, NO2, OH, OR, CF3, halo, CN, CO2H, CONH2, CONHR, CON(R)₂, COR, SR, S(O)R, S(O)₂R, S(O)₂NHR or R;

R is a C₁-C₆ straight chain or branched alkyl or alkenyl group, a 5-7 membered aromatic or non-aromatic carbocyclic or heterocyclic ring, or a 9-10 membered bicyclic aromatic or non-aromatic carbocyclic or

-129-

heterocyclic ring system; and Z is CH or N.

....

- 2. The compound according to claim 1, wherein 5 Y is  $-(CH_2)-Q_1$  and  $Q_1$  is a substituted phenyl.
  - 3. The compound according to claim 1, wherein the compound is selected from any one of the compounds depicted in Table 1.

10

4. A pharmaceutical composition comprising an amount of a compound according to any one of claims 1 to 3 effective to inhibit JNK, and a pharmaceutically acceptable carrier.

15

30

- 5. Use of the composition according to claim 4 for the manufacture of a medicament for treating or preventing inflammatory diseases, autoimmune diseases, destructive bone disorders, proliferative disorders, infectious diseases, neurodegenerative diseases, allergies, reperfusion/ischemia in stroke, heart attacks, angiogenic disorders, organ hypoxia, vascular hyperplasia, cardiac hypertrophy, thrombin-induced platelet aggregation or conditions associated with proinflammatory cytokines in a patient in need thereof.
  - 6. The use according to claim 5, wherein said treating or preventing is for an inflammatory disease selected from acute pancreatitis, chronic pancreatitis, asthma, allergies, or adult respiratory distress syndrome.
    - The use according to claim 5, wherein said

.

PCT/US00/10866

treating or preventing is for an autoimmune disease selected from glomerulonephritis, rheumatoid arthritis, systemic lupus erythematosus, scleroderma, chronic thyroiditis, Graves' disease, autoimmune gastritis, diabetes, autoimmune hemolytic anemia, autoimmune neutropenia, thrombocytopenia, atopic dermatitis, chronic active hepatitis, myasthenia gravis, multiple sclerosis, inflammatory bowel disease, ulcerative colitis, Crohn's disease, psoriasis, or graft vs. host disease.

10

WO 00/64872

8. The use according to claim 5, wherein said wherein said treating or preventing is for a destructive bone disorders selected from osteoarthritis, osteoporosis or multiple myeloma-related bone disorder.

15

20

- 9. The use according to claim 5, wherein said wherein said treating or preventing is for a proliferative disease selected from acute myelogenous leukemia, chronic myelogenous leukemia, metastatic melanoma, Kaposi's sarcoma, or multiple myeloma.
- 10. The use according to claim 5, wherein said wherein said treating or preventing is for a neurodegenerative disease selected from Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, cerebral ischemia or neurodegenerative disease caused by traumatic injury, glutamate neurotoxicity or hypoxia.
- 30 11. The use according to claim 5, wherein said wherein said treating or preventing is for ischemia/reperfusion in stroke or myocardial ischemia,

-131-

renal ischemia, heart attacks, organ hypoxia or thrombininduced platelet aggregation.

- 12. The use according to claim 5, wherein said wherein said treating or preventing is for a condition associated with T-cell activation or pathologic immune responses.
- 13. The use according to claim 5, wherein said
  10 wherein said treating or preventing is for an angiogenic
  disorder selected from solid tumors, ocular
  neovasculization, or infantile haemangiomas.
